What can the American obsession with a perfect lawn tell us about environmental dilemmas? What happens when the online world means that “here comes everybody”? At what point does an embryo or fetus become human? At what point do animals embody rights that we should recognize? What do we learn about the ethical boundaries of human nature and of science itself through controversial research such as Stanley Milgram’s obedience experiments?

Join us for an introduction to these legal, social, ethical, psychological, and cultural issues as we consider how the history behind them has shaped the modern techno-scientific world we live in today. Students from any major are warmly welcomed to enroll – no previous advanced scientific or technological background is required.

provides western civ core IV gen ed credit. For more info, contact prof. katherine pandora at kpandora@ou.edu or 325.3427
