Gender Issues in Science, Technology, & Medicine: Historical Perspectives

Join us in looking at how issues of gender have been intertwined with science, technology, and medicine from the scientific revolution to the present. We’ll look at women as objects of inquiry in science and medicine, examine the paths they took to entering the professional world, and consider gendered aspects of the consumption of scientific, medical, and technical products.

We’ll pay close attention to gendered images and narratives in past and present media, consider such novel forms of critique as feminist science fiction . . . and much more!
