The Chemistry Department’s Research Support Services Stockroom (Chemistry Stockroom) provides OU researchers and administrative staff with access to a wide range of laboratory and office supplies as well as chemicals. In addition, the Chemistry Stockroom facilitates departmental shipments. It is in the performance of these responsibilities that the Chemical Stockroom may encounter export control issues.

An export is any item, including commodities, software, or technology that is sent from the United States to a foreign destination. Depending on the item or technology, certain license requirements may apply. The U.S. Government requires people shipping certain items and technologies outside the U.S. to obtain licenses. Depending on the item and the destination, licenses may not be available. The U.S. Government considers Cuba, Iran, North Korea, Sudan and Syria to be State Sponsors of Terrorism. As such, exports are extremely limited and regulated. Criminal and civil penalties exist for violations of export control regulations. These penalties can apply whether the penalized action was taken knowingly or not. The Office of Export Controls should be contacted before an international shipment is made. An e-mail containing the item(s) being shipped and the recipient of the shipment should be sent to the Office of Export Controls. The Office of Export Controls will screen the information for any applicable license requirements and communicate the findings to the Chemistry Stockroom as soon as possible.

The Office of Export Controls
